Kurzbeschreibung This essay is an in-depth analysis that explores the use of tectonics and how it is driven by the craft and efficiency of technology. Excerpt from introduction: "A dilemma worthy of a drama, as if this situation were a novel of an Architect, a protagonist with intentions of integrating design intent into all aspects governing the layers of a building trying to achieve a sincere expression for which its users can participate empathetically. To extend the metaphor, it would only make sense to characterize the legal system as the antagonist divorcing the Architect from construction and structure. As a result, the Architect is renounced with a structure lacking a system or principle that remains unfaithful to a vision. In distress, the adroit Architect refuses to succumb to the opposition and employs a tool that has existed since Architecture itself: Tectonics."
